

Method For Treatment of Intracerebral Tumors

Abstract of Disclosure

The method for treatment of intracerebral tumors, consists in performing cytokine immunotherapy followed by neurosurgical intervention for a total resection of the intracerebral tumor. The cytokine therapy comprises intravenous administration of a preset dose of lymphokine-activated killer cells together with recombinant yeast interleukin-2 in a daily dose of up to 2 million IU, the administration being in fact a prolonged infusion from one to three days for four or five hours daily.
